

## Antibacterial paper that also offers protection against coronavirus

Developed to provide health security and peace of mind.

Radeče papir nova represents an important innovation in the R Copy® Paper family of products. Bacteria and viruses are our constant invisible companions. Materials such as paper easily become potential transfer points for their spread.

Antibacterial paper is treated with antimicrobial and antiviral Sanitized® technology to protect it from bacteria and viruses. Recent tests run on antibacterial paper show efficacy against feline coronavirus. Testing at an independent laboratory, MSL Solutions Providers, UK, showed up to a 94 percent reduction in coronavirus viability within two hours. Testing was performed on feline coronavirus, which comes from the same family as SARS-CoV-2 and has almost the same structure.

Antibacterial paper is also protected against many bacteria. Tests have confirmed that gram-negative, gram-positive and antibiotic-resistant bacteria such as MRSA cannot develop on paper. The Pulp and Paper Institute, however, has confirmed that paper with an integrated antibacterial agent is protected against the E-Coli bacteria.

### Where and why do we recommend antibacterial paper?

Restricting the spread of bacteria is especially important for people with a weakened immune system, who are particularly at risk of developing infections.

We recommend the use of antibacterial paper for printing and copying documents that pass through the hands of many people: in healthcare, laboratories, catering, education and state and local institutions.

### Maintain health security! Products with innovative antibacterial protection.

Antibacterial paper is used for many paper products: office paper, labels, envelopes, business cards, personalised products, as well as for protected and security documents.

## Certificates (antibacterial in antiviral test):

## Security solutions, designed to protect your documents.

Radeče papir nova is one of the leading producers of secure paper solutions. We manufacture paper that incorporates various security features designed to prove the authenticity of the material and prevent falsification of documents. As it is practically impossible to remove such features without damaging the surface of the base material, we help protect our customer's passports, certificates, visas, tax stamps, cheques, etc. Our expertise based on tradition and the use of modern technology is reflected in the quality of all the security solutions that we proudly produce in our facility.
